

# Biomedical Technologies and Innovation Doctoral Programme (BIOTIN)

<b>Title of the PhD Project</b>	<b>Development of novel quantum-mechanical descriptors for nano-biomaterials and their application to predicting toxicity</b>
<b>Acronym</b>	<b>QMDESforNANO</b>
<b>Research Fields of the Project</b>	Nanotoxicology, Bioinformatics, Quantum Mechanics
<b>Keywords</b>	nanomaterials, predictive toxicology, machine learning, density functional theory
<b>Host Institution, Department and Campus Location</b>	Izmir Institute of Technology, Bioengineering Department, Urla/Izmir
<b>PhD Awarding Institution and Graduate Programme</b>	Izmir Institute of Technology, Graduate School, PhD in Bioengineering
<b>Name and Affiliation of Main Supervisor</b>	Asst. Prof. Ceyda Öksel Karakuş (IZTECH)
<b>Name and Affiliation of Cosupervisors</b>	Prof. Hasan Sahin (IZTECH) Assoc. Prof. Gokhan Karakulah (IBG)
<b>Research Environment and Infrastructure</b>	The selected candidate will have access to the research infrastructure available at Izmir Institute of Technology and Izmir Biomedicine and Genome Center. When a specific instrument or expertise is needed, all other national laboratories will also be contacted.  <a href="http://safebionano.com/">http://safebionano.com/</a>
<b>Scientific Context of the Project</b>	The rapid rise of nanotechnology has resulted in a parallel rise in the number of products containing nanomaterials. The unusual properties that nano forms of materials exhibit relative to the bulk has driven intense research interest and relatively rapid adoption by industry. Regulatory agencies are charged with protecting workers, the public, and the environment from any adverse effects of nanomaterials that may also arise because of these novel physical and chemical properties. They need data and models that allow them to flag nanomaterials that may be of concern, while balancing potential stifling of commercial innovation.  Life sciences are progressively becoming more computational, relying on data-driven models to assist or replace experimental testing. Unlike bulk chemicals where we have large datasets to learn from, a major constraint hampering the development of models that can robustly predict nanomaterial properties and activity is the frequent lack of adequate descriptor data upon which to base estimates of model parameters.

	<p>Computed theoretical descriptors that capture important structural properties of nanomaterials provide diverse sources of chemical properties and a broad coverage of the vast chemical property space describing all possible nanomaterials. Experimentally derived descriptors (e.g. size shape, solubility, agglomeration, etc) are of very limited use in machine learning models of biological effects of nanomaterials, not only because of their time and resource intensiveness, but also because they are not available for designed or otherwise hypothetical materials not yet synthesized.</p> <p>The core principle of machine learning in predictive toxicity domain is the expectation that structurally similar compounds will have similar biological activities. Molecular descriptors are commonly used in studies of molecular similarity to quantify the degree of structural overlap. However, almost all existing theoretical descriptors currently used are not nano-specific, meaning they are incapable of reliably discriminating between different-size forms of the same chemical substance. Development of novel descriptors that capture the specificity of nanoscale properties and the changes they undergo in different biological environments remains a challenging task, and will be an area of active research for some time.</p>
<p><b>Brief Workplan</b></p>	<p>The main aim of this thesis is to develop novel descriptors that can adequately express the size, time and environment-dependent properties of nanostructured materials that are commonly used in biomedical applications. The tentative yearly workplan is presented below:</p> <ul style="list-style-type: none"> <li>• <b>1<sup>st</sup> Year:</b> Training in machine learning and data analytic tools, performing simple case studies with literature data</li> <li>• <b>2<sup>nd</sup> Year:</b> Training in quantum-mechanical calculations such as Density Functional Theory, developing novel theoretical descriptors for metallic nanoparticles</li> <li>• <b>3<sup>rd</sup> Year:</b> Application of both machine learning and quantum-mechanical approaches to experimental in-house nanotoxicity data, development of computational models that can predict the toxicity of nanoparticle-containing products</li> </ul>
<p><b>Innovative Aspects of the Project</b></p>	<p>The outcomes of the project will help develop innovative and feasible safer-by-design strategies for nanomaterials that are commonly used in biomedical applications and enable inherently safer design of advanced materials through structural manipulations. Thanks to the computational models developed using novel nanodescriptors, it will be possible to predict toxicity of nanomaterials at the design stage.</p>
<p><b>Training Opportunities of the Project</b></p>	<p>The selected candidate will be offered various training opportunities in the convergence of life sciences, material sciences and data science. The supervisory team and student will discuss and form a training plan at the start of the PhD, considering both personal interests and scientific needs.</p>

**Biomedical Technologies and Innovation  
Doctoral Programme (BIOTIN)**

<b>Interdisciplinary Aspects</b>	The selected candidate will be supervised by three experts in nanotoxicology, quantum mechanics and bioinformatics. He/she will be working towards addressing multifaceted and multidisciplinary sub-topics that sit at the intersection of health, advanced materials and data science.
<b>Intersectoral Mobility</b> <input checked="" type="checkbox"/> Short Visit <input type="checkbox"/> Secondment	<i>Host:</i> Siemens Healthineers (TR) <i>Context of Mobility:</i> Innovation management, Entrepreneurship, Prototyping, IP rights, 3D modelling
<b>Intersectoral Mobility</b> <input checked="" type="checkbox"/> Short Visit <input type="checkbox"/> Secondment	<i>Host:</i> Istanbul Health Industry Cluster (ISEK) <i>Context of Mobility:</i> Entrepreneurship Training, Thematic Pre-incubation Program
<b>International Academic Secondment</b>	<i>Host Supervisor:</i> Prof. Francois M. PEETERS <i>Host Institution:</i> University of Antwerp, Antwerp, Belgium <i>Host Department:</i> Department of Physics <i>Duration:</i> 6 months <i>Estimated Time of Mobility:</i> 2 <sup>nd</sup> Year
